Technical information for Raw Material used in **NICE** Laboratory Glassware

1. General Properties

Glass excels by its very good chemical resistance against water, Saline solutions, Acids, Alkalis and Organic solvents and exceeds most plastics in this regard. It is only attacked by hydrofluoric acid and at elevated temperature by strong alkalis and concentrated phosphoric acid. Further advantages of glass are its dimensional stability even at elevated temperature, and its high transparency.

2. Chemical Composition

NICE glass is a low alkali borosilicate type 3.3 glass. It is considered the technical all round for applications requiring very good chemical thermal resistance (including resistance to thermal shock) and high mechanical stability. Its typical chemical composition is given below.

	Approx % by weight
SiO ₂	81
B ₂ O ₃	13
Na ₂ O/K ₂ O	4
Al ₂ O ₃	2

3. Thermal Properties

NICE glassware have following thermal properties:

Coefficient of Linear expansion	:	3.3 x 10 ⁻⁶ / °C
Thermal conductivity	:	0.0027 (Cal/cm ³ / °C/Sec)
Specific heat	:	0.2
Strain point	:	515 °C
Annealing point	:	565 °C
Softening point	:	820 °C

The above data supports the fact that the coefficient of linear expansion is very low and hence the temperature gradient is also low enabling the glass to with stand higher temperature and thermal shock.

NICE glassware is screen printed and annealed in a furnace at 565°C to ensure minimum residual stress.

4. Chemical resistance

NICE[®] borosilicate glassware has superior chemical resistance. This class of glassware represents the least reactive glassware available. It is highly resistance to water, neutral and acid solutions, concentrated acids as well as chlorine, bromine, iodine and organic materials due to its relatively low alkali content.

5. Mechanical resistance

Thermal Stresses : During the production and processing of glass, hazardous thermal stresses may be introduced. During the cooling of the melted glass in the range between the upper and lower annealing point, the transition from the plastic state to the brittle state takes place. At this stage, existing thermal stresses can be eliminated through a carefully controlled annealing process.

6. Safety measures & Handling Guideline

NICE[®] glassware is manufactured with care from high quality Borosilicate tubes. However, certain precaution while using the same will extend the life and performance of the ware adding value to the cost with increased satisfaction.

Working with Glass:

When working with glass, it is essential to consider its limitations regarding to thermal shock and to mechanical stress. Strict safety measures must be observed : Exothermic reactions such as the diluting of sulphuric acid or dissolving solid alkaline hydroxides must always be carried out under stirring and cooling and in suitable vessels such as Erlenmeyer flasks, never in graduated cylinders or volumetric flasks.

Do not heat up volumetric instruments, e.g. measuring cylinders, flasks on direct flame. Glass instruments must never be exposed to sudden temperature changes. Therefore never take them out of a drying cabinet while hot, and place them on a cold or even wet bench. This applies especially to thick-walled glass instruments such as filtering or desiccators.

When assembling apparatus, support the components in a way to ensure stability and to avoid mechanical stress. To compensate stresses or vibrations, use e.g. PTFE bellows.

Never subject glass instruments to sudden pressure changes; e.g. never admit air abruptly into evacuated glass apparatus. Glass vessels with flat bottom (e.g. Erlenmeyer flasks or flat-bottom flasks) must never be evacuated. The only exceptions are instruments specifically designed for vacuum use (e.g. desiccators, filtering flasks).

Never exert force on stiff stopcocks, ground joints, or glass/tubing connections. Apply effort only in a steady and controlled way upon empty glass instruments; never when they are under pressure or evacuated. Use appropriate safety devices. e.g. Protective gloves, screens etc.
